\{\}noindent Hello forml team,

I'm applying for the Software Engineer role at forml. I was drawn to your work in redefining how businesses integrate and utilize AI/ML, particularly through scalable back-end solutions using Flask, Redis, and Celery.

My core strengths are in Python and systems-level development, with a focus on building secure, observable, and scalable software solutions. I am adept at working across cloud environments like AWS, Azure, and GCP, containerizing with Docker/Kubernetes, provisioning with Terraform, and implementing CI/CD pipelines to ensure that all processes are testable, versioned, and easy to roll back.

At a previous role, I engineered a solution that consolidated diverse enterprise systems—including Rapid7, Jamf, and BigFix—into a unified platform. I automated the end-to-end workflow from data aggregation to remediation, which reduced manual effort by over 100 hours per month and improved the organization's visibility and response capabilities across thousands of endpoints.

Earlier, I developed custom automation and tooling to analyze system behavior, identify anomalies, and harden production environments. These projects leaned on the same foundations you need: robust system architecture, strong authentication and secrets management, and disciplined monitoring and alerting to maintain high availability and performance.

Sincerely, Conner Jordan
