Hiring Team,

[Date]

Hiring Team,

I'm applying for the Security Engineer role at PrizePicks. I was drawn to your work in developing security practices and tooling to protect the company and customers.

At a previous role, I engineered a solution that consolidated diverse enterprise systems—including Rapid7, Jamf, and BigFix—into a unified platform. I automated the end-to-end workflow from data aggregation to remediation, which reduced manual effort by over 100 hours per month and improved the organization's visibility and response capabilities across thousands of endpoints.

Earlier, I developed custom automation and tooling to analyze system behavior, identify anomalies, and harden production environments. These projects leaned on the same foundations you need: robust system architecture, strong authentication and secrets management, and disciplined monitoring and alerting to maintain high availability and performance.

I am comfortable owning the entire lifecycle of a solution, from design through deployment and operations. This includes architecting and implementing features, instrumenting pipelines, documenting APIs and system contracts, and collaborating closely with cross-functional teams. While my experience is broad, I can ramp quickly on any specific technology stack your team uses.

If your mandate is to build reliable, secure, and scalable software that solves complex problems and protect digital assets, I would like to help you ship that.

Sincerely, Conner Jordan
