August 13, 2025

\{\}noindent Hello Velocity Games team,

I'm applying for the DevOps Engineer role at Velocity Games. I was drawn to your work in building and maintaining robust cloud infrastructure that supports immersive online multiplayer gaming experiences. My core strengths are in Python and systems-level development, with a focus on building secure, observable, and scalable software solutions. I am adept at working across cloud environments like AWS, Azure, and GCP, containerizing with Docker/Kubernetes, provisioning with Terraform, and implementing CI/CD pipelines to ensure that all processes are testable, versioned, and easy to roll back.

At a previous role, I engineered a solution that consolidated diverse enterprise systems—including Rapid7, Jamf, and BigFix—into a unified platform. I automated the end-to-end workflow from data aggregation to remediation, which reduced manual effort by over 100 hours per month and improved the organization's visibility and response capabilities across thousands of endpoints.

Earlier, I developed custom automation and tooling to analyze system behavior, identify anomalies, and harden production environments. These projects leaned on the same foundations you need: robust system architecture, strong authentication and secrets management, and disciplined monitoring and alerting to maintain high availability and performance. I am comfortable owning the entire lifecycle of a solution, from design through deployment and operations. This includes architecting and implementing features, instrumenting pipelines, documenting APIs and system contracts, and collaborating closely with cross-functional teams.

If your mandate is to build reliable, secure, and scalable software that solves complex problems in the gaming industry, I would like to help you ship that.

Sincerely, Conner Jordan
