August 13, 2025

Hello [Company Name] team,

I'm applying for the Software Engineer role at [Company Name]. I was drawn to your work in building next-generation cloud infrastructure.

My core strengths are in Python and systems-level development, with a focus on building secure, observable, and scalable software solutions. I am adept at working across cloud environments like AWS, Azure, and GCP, containerizing with Docker/Kubernetes, provisioning with Terraform, and implementing CI/CD pipelines to ensure that all processes are testable, versioned, and easy to roll back. My experience in consolidating diverse enterprise systems into unified platforms, automating workflows, and improving response capabilities aligns perfectly with your needs.

At a previous role, I engineered a solution that consolidated diverse enterprise systems—including Rapid7, Jamf, and BigFix—into a unified platform. I automated the end-to-end workflow from data aggregation to remediation, which reduced manual effort by over 100 hours per month and improved the organization's visibility and response capabilities across thousands of endpoints. I also developed custom automation and tooling to analyze system behavior, identify anomalies, and harden production environments, focusing on robust system architecture, strong authentication and secrets management, and disciplined monitoring and alerting.

I am comfortable owning the entire lifecycle of a solution, from design through deployment and operations. This includes architecting and implementing features, instrumenting pipelines, documenting APIs and system contracts, and collaborating closely with cross-functional teams. My broad experience allows me to quickly ramp up on any specific technology stack your team uses. I am confident I can make significant contributions to your team.

Sincerely, Conner Jordan
